

Powers of 10

<u>Multiplication</u>	<u>Power of 10</u>
10×1	10^1
10×10	10^2
$10 \times 10 \times 10$	10^3
$10 \times 10 \times 10 \times 10$	10^4

* When you multiply by 10, you move one place value to the right (your decimal shifts to the right the same number of zeros you have)

ex. 3.6×10^2

$3.6 \times \underline{10} \times \underline{10}$ (2 zeros)

$3.6 \xrightarrow{\text{Shift 1}} \underset{\cdot}{3}6 \xrightarrow{\text{Shift 2}} \underset{\cdot}{3}600 = 3600.$

* When you divide you do the opposite

5.NBT.2 Powers of 10

I can explain patterns in the number of zeros in a product and the placement of a decimal point, when multiplying or dividing a number by a power of 10. I can use whole-number exponents to denote powers of 10.

$$5 \times 1 = \underline{5}$$

$$5 \times 10 = \underline{50}$$

$$5 \times 100 = \underline{500}$$

$$5 \times 1000 = \underline{5,000}$$

What patterns do you notice?

One zero is added each time. The number of zeros in the factor is the same number of zeros in the product.

$$5 \div 1 = \underline{5}$$

$$5 \div 10 = \underline{0.5}$$

$$5 \div 100 = \underline{0.05}$$

$$5 \div 1000 = \underline{0.005}$$

What patterns do you notice?

The place value of the 5 changes depending on the number of zeros in the factors.

$$5 \times 10^1 = \underline{50}$$

$$5 \times 10^2 = \underline{500}$$

$$5 \times 10^3 = \underline{5,000}$$

$$5 \times 10^4 = \underline{50,000}$$

What patterns do you notice?

The number of zeros matches the exponent of power of 10.

$$23 \times 100 =$$

$$\underline{2,300}$$

$$15 \div 1000 =$$

$$\underline{0.015}$$

$$12 \times 100 =$$

$$\underline{1,200}$$

$$316 \times 10 =$$

$$\underline{3,160}$$

$$26 \div 100 =$$

$$\underline{0.26}$$

$$19 \times 1000 =$$

$$\underline{19,000}$$

$$9 \times 10000 =$$

$$\underline{90,000}$$

$$83 \times 10,000 =$$

$$\underline{830,000}$$
